Observer Pattern

publish ⇔ subscribe

Architecture, Modeling, Design Pattern, Behavioral

Implemention

```
public final class Observer<T> {
    public interface Subscriber<T> {
        void onSubscribe(T data);
    }

    private final HashMap<String, Subscriber<T>> manager = new HashMap<>();

    public final void subscribe(Subscriber<T> subscriber) {
        if(subscriber == null)
            return;

        manager.put(subscriber.getClass().getName(), subscriber);
    }

    public final void publish(T data) {
        if(data == null)
            return;

        for(Subscriber<T> listener : manager.values()) {
            listener.onSubscribe(data);
        }
    }
}
```
